Visualization to recreate and produce homage to:

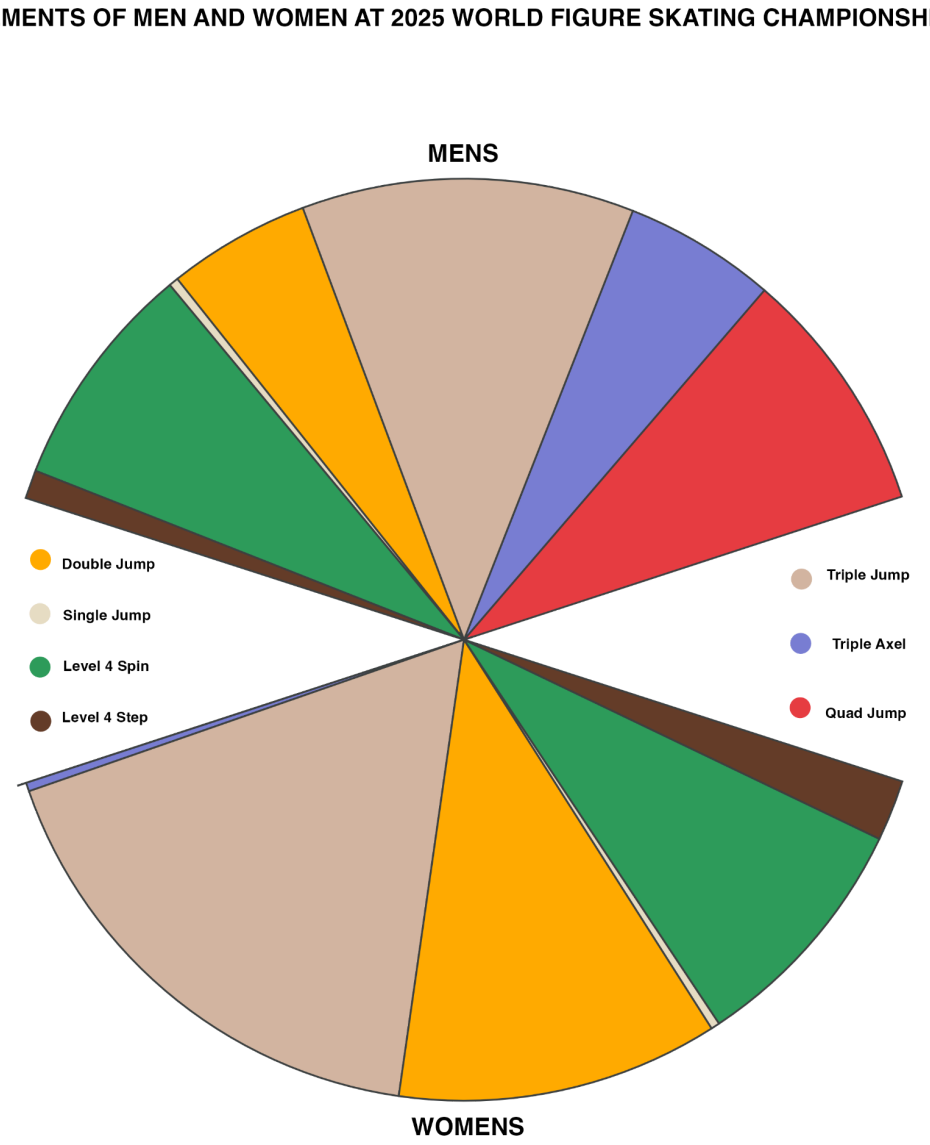

My redesign:

I chose to redesign DuBois' initial plot into this offset bar chart. One of the flaws I found with the original specifically was the lack of readability of the graph as a whole. While it does contain the exact percentages and is visually striking, it is hard to estimate visually which pieces of the pie are the biggest, and what the focus should be. Other than that there is a striking amount of red, there is not much more to read into in my opinion. As such, I decided to make it clear that we are comparing the occupations of Blacks and whites in Georgia, by having the dot-connected lines directly on top of each other. Additionally, I attempted to directly label the graph, with the "Black" and "White" labels directly on top of two of the lines, as well as the exact percentage mark at the end of the lines. I believe that in my new redesign, it is much easier to both compare between occupations between the two demographics as well as compare across occupations. It is clear that the agriculture occupation demonstrated the highest percentage of the workforce.

My homage:

For the homage, I chose to use data from the 2025 figure skating world championships. With the Winter Olympics currently in play, I thought it would be an interesting event to pull data from. From the judging protocols, I gathered the amount of times the top ten men and women completed each type of event. I disregarded attempts that were not successful. I used the half fan-style pie chart of DuBois as the basis of my plot. While I had initially thought that it might prove to be a tall task to recreate such an nontypical style of pie chart, I quickly realized that I could just add two observations representing the gaps on the sides to my dataset. That way, with a bit of further rearranging of the observations, it would function as a normal pie chart/stacked bar chart. One of the main challenges however were the labels for the legend. I had initially not realized that when you call (coord_polar) to change it from a stacked bar chart to

a pie chart, that it would also alter the x, y inputs for the annotation function. As such, it took quite a bit of fiddling around to line up the points and text labels for my makeshift legend. Instead of merely using an x, y cartesian scale, I had to do it with degrees and radius. Overall, I think the data visualization mirrors closely with DuBois' original plot, and the data I used does indeed tell a story. We can see that certain elements, i.e. quadruple jumps were only successfully landed by the male skaters. Additionally, we can see that the famed triple axel was indeed landed successfully by a woman, which is extremely impressive and frankly out of the norm.
