Wall Drawing 112: On a wall surface, any continuous stretch of wall, using a hard pencil, place 50 points at random. The points should be evenly distributed over the area of the wall. All of the points should be connected by straight lines.

To randomize, I decided to splash carelessly a brown liquid onto a sheet of paper. After drying, where the splatters formed would form the basis of the points locations.

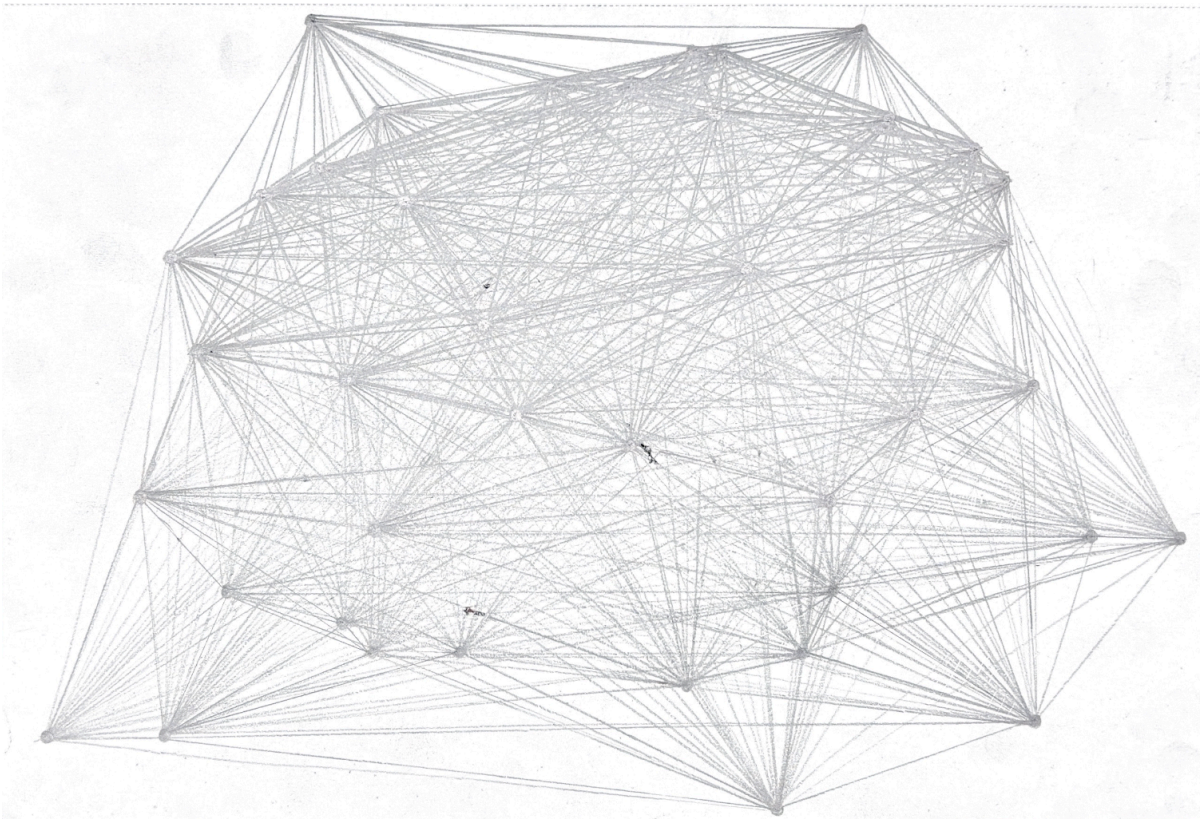

Here is the initial splash:

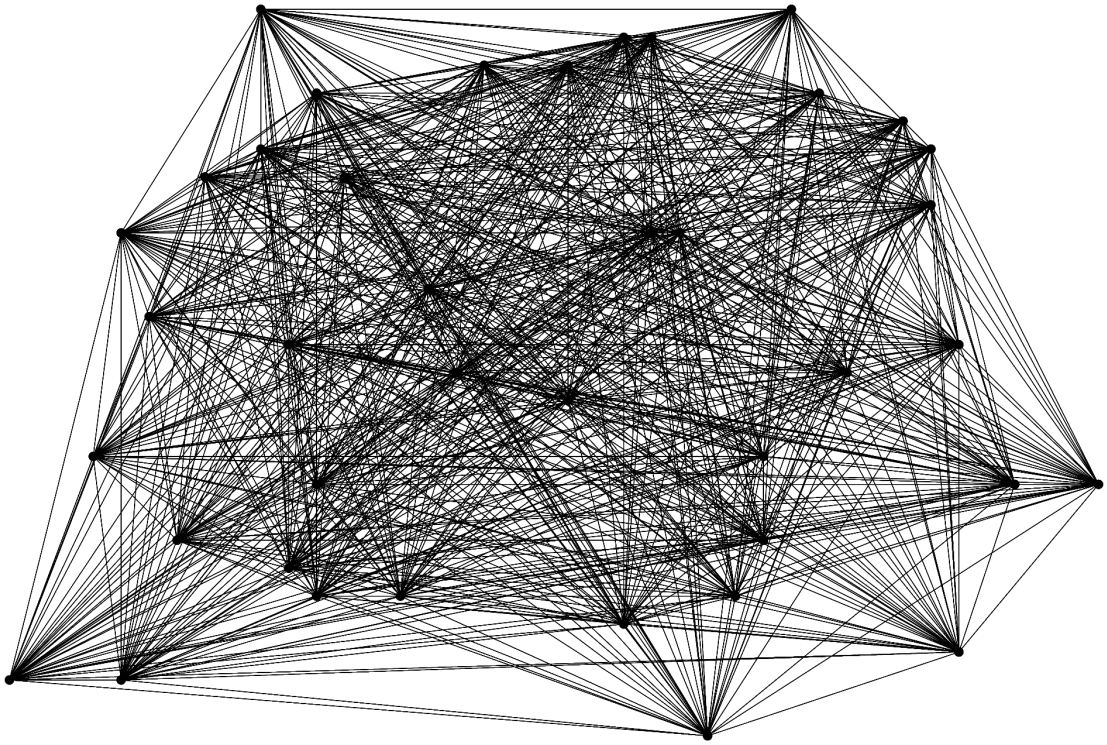

I used Figma to overlay a grid, plotting a point for every shape created by the splash, up to 40:

Then, I drew the connecting lines for my final version of Wall Drawing 112:

Followed by my version recreated in ggplot:

For my redesign, I decided to go with Wall Drawing 422:

“The room (or wall) is divided vertically into fifteen parts. All one-, two-, three-, and four-part combinations of four colors, using color ink washes.”

For this drawing in particular, the only data that I could extract were the four initial colors. The grayish beige, yellow, red, and blue. After that, it was up to blending colors to generate the rest.

My version in ggplot:

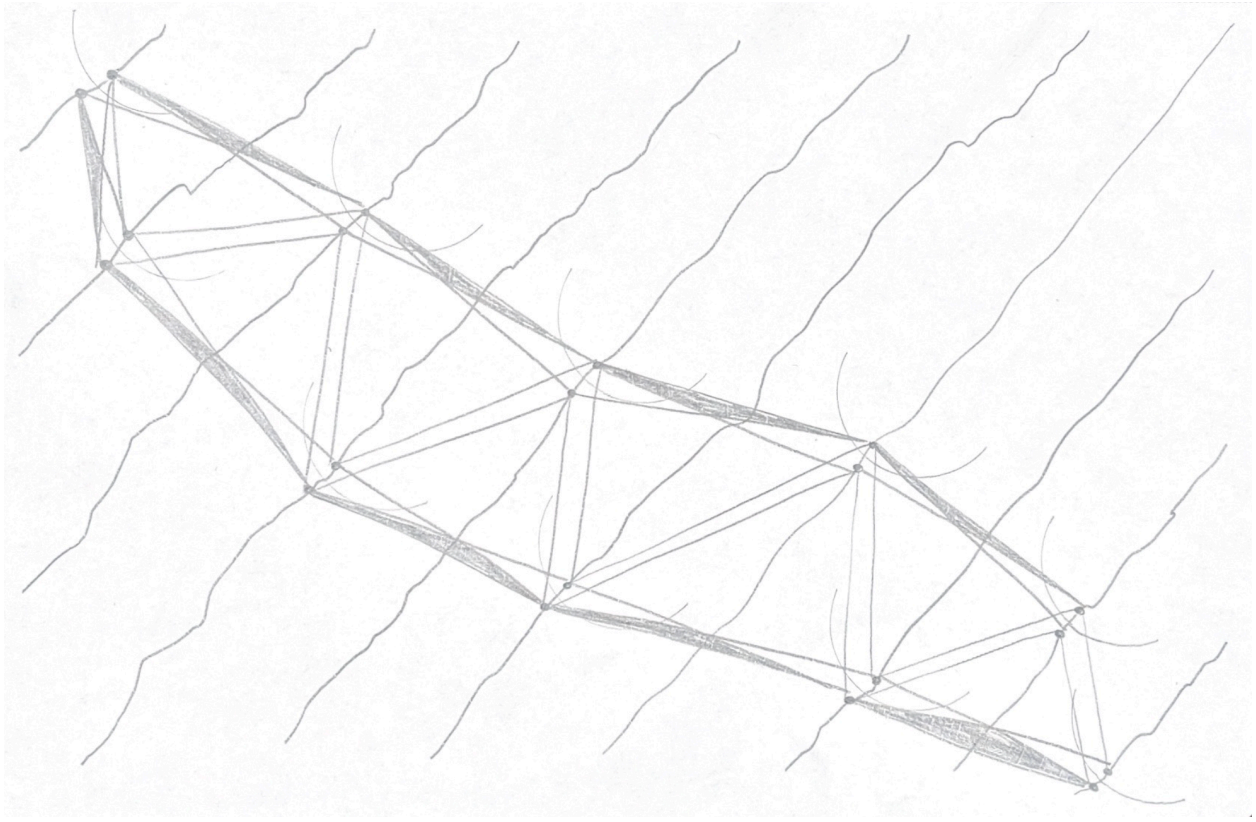

Some of my colors seemed to be off of what the Mass MOCA gallery version had. I believe that this could have been due to the different methods of blending colors. I can imagine that purely blending colors based on RGB values and mixing paints in real life can produce vastly different results. An overall trend of my colors when comparing to the in person version was the vibrancy. Mine were much more muted, especially when comparing the browns and oranges.

Lastly, my homage.

Wall Drawing Homage: Draw parallel non straight lines diagonally across the wall. Place two points outside of alternating semi circles on the lines. Connect all points on adjacent lines with straight lines, then heavily shade the outer boundary of the resulting shape.

My version:

I like how it looks almost like a bridge structure on a flowing river.
